

NEURODIVERSITY

Neurodiversity is a difference in brain function.

Neurodivergent:

is a person whose brain functions differently from what is considered typical.

Neurotypical:

is a person whose brain functions in what is considered to be typical.

We may see communication differences between neurotypical and neurodivergent people. They may socialize differently and view social rules differently. We might see differences in eye contact, body language, tone of voice, and conversational styles.

There are many diagnosis that would fall under the category of Neurodivergent including Autism, ADHD, and Dyslexia.

Different is NOT a bad thing!
